

Have you had a horse diagnosed with insulin resistance, ulcers, allergies, lameness, back pain, hyperactivity, colic, hoof problems, arthritis, osteochondrosis (OCD)?

Almost every equine ailment can be improved and supported by good natural nutritional management.

We believe that choosing organic is best for both your horse and our planet; choosing organic reduces potential harm from pesticide residues, and synthetic chemicals, and respects the delicate ecosystem that our world depends on.

These residues have an impact on our neurological, hormonal and immune systems and exist in any feed that is not grown organically.

GENESIS™
ORGANIC HORSE FEED

How will food grown organically have a positive health effect for our horses? The nutrient quality will go up. Beneficial mineral uptake increases while uptake of toxic metals decreases. Most importantly the low level residues of pesticides and herbicides will greatly diminish or are absent.

Many complete feeds on the market today have been grown conventionally, treated with high temperatures, and/or pounded into powder during processing, or genetically modified.

These practices destroy vital nutrients and as such the feeds need to be fortified with vitamins and minerals, often the additives are from unnatural sources.

DOESN'T YOUR HORSE DESERVES THE BEST FEED IN THE WORLD?
